

What objectives need to be selected is the first step to be made for environmentally improving QOL for inhabitants.

Reducing CO₂ could be an essential objective in global or each country level.

However, in a local government level, it may be no first prioritized objective; easing the heat-island phenomenon is, rather, the highest one especially in extremely urbanized areas. Following realizing that objective, secondary objectives, such as reducing CO₂ or activating commercial activities, could be naturally resolved with no or less additional measures.

JTPA has introduced know-hows for environmentally improve QOL in several cities in Japan.
